

Rate Analyser

Rate Analyser is a web-based system that sits on top of all booking made in Hotel Booker (both Express and Professional) and analyses them against all the other rates available at that property and similar inventory.

Rate Analyser works as a robotic tool and regularly checks the rates and detail of all live bookings daily to ensure that the travel management company is securing the best rate available for its clients. This tool operates once every evening up to and including the night before check-in but is configurable and can therefore be adjusted to the client's requirements. For example, it will check not only the rates in the booked property but those for comparable accommodation in the vicinity; as it is configurable, this can be to the client's specification, say whether within five or ten miles.

This price shopping tool compares the rate booked with all available electronic rates. The system collects and stores more than 13 million rates a month and builds up a valuable audit trail for TMCs to demonstrate value added for their clients.

Rate Analyser enables agencies to be able to guarantee that they are securing best rates. It allows for full transparency and visibility.
